

Automotive Cybersecurity Solutions

Secure Every Vehicle. Protect Every Connection. Build Trust into Every Drive.

The modern automobile is no longer just a mechanical machine—it is a connected, software-driven platform. From advanced driver assistance systems and infotainment to telematics, connected services, electronic control units, gateways, and over-the-air updates, vehicles depend on increasingly complex software and communication networks. With this transformation comes a growing cybersecurity risk.

secureXmotive helps automotive manufacturers, Tier-1 suppliers, technology providers, and mobility companies identify, manage, and mitigate cybersecurity risks across the vehicle lifecycle.

Our automotive cybersecurity services are designed to support organizations from the earliest stages of vehicle development through production, deployment, monitoring, incident response, and end-of-life. We help organizations establish cybersecurity as an integral part of vehicle engineering rather than treating it as an afterthought.

Our expertise covers **TARA, cybersecurity concept development, secure architecture, threat modelling, risk assessment, security requirements, cybersecurity validation, penetration testing, vulnerability management, incident response, and cybersecurity lifecycle management.**

As vehicles become increasingly connected, attack surfaces continue to expand. Wireless interfaces, cellular connectivity, Bluetooth, Wi-Fi, USB, diagnostics, telematics, mobile applications, cloud platforms, and backend systems can all become potential entry points for attackers. secureXmotive helps identify these attack paths and establish appropriate security controls.

We also help organizations align their cybersecurity programs with industry expectations and regulatory requirements, including **ISO/SAE 21434 and UN R155**, while supporting cybersecurity processes throughout the development lifecycle.

Our services extend beyond individual vehicle components. We assess cybersecurity across the broader ecosystem—including ECUs, in-vehicle networks, gateways, cloud infrastructure, mobile applications, diagnostic systems, OTA platforms, and connected services.

What secureXmotive Can Help You With

- Automotive Cybersecurity Management Systems (CSMS)
- Threat Analysis and Risk Assessment (TARA)
- Vehicle and ECU cybersecurity architecture
- Cybersecurity requirements engineering
- Secure design and development
- Penetration testing and vulnerability assessment
- Vehicle and ECU security testing
- Diagnostic security
- OTA cybersecurity
- Vehicle network and communication security

- SBOM and vulnerability management
- Incident response and vulnerability monitoring
- UN R155 and ISO/SAE 21434 readiness
- Cybersecurity program and process implementation

Why secureXmotive?

Because vehicle cybersecurity is not simply about protecting software—it is about protecting **vehicles, passengers, businesses, data, and brand reputation**.

At secureXmotive, we combine automotive domain knowledge with cybersecurity expertise to help organizations build vehicles that are secure by design, resilient against emerging threats, and prepared for the connected future.

secureXmotive — Driving Cybersecurity into the Future of Mobility.
