

Commercial Vehicle Cybersecurity

Protect the Vehicles That Keep Businesses Moving.

Trucks, buses, coaches, delivery vehicles, and other commercial vehicles are rapidly evolving into connected digital platforms. Telematics, fleet management, remote diagnostics, ADAS, infotainment, connected services, electronic control units, and OTA updates are transforming how commercial fleets operate.

But every new connection introduces another potential cybersecurity risk.

secureXmotive helps truck, bus, and commercial vehicle manufacturers protect their vehicles, fleets, infrastructure, and connected services against evolving cyber threats.

For commercial fleets, cybersecurity is directly linked to business continuity. A cyber incident affecting vehicle availability, fleet management, remote services, logistics systems, or critical vehicle functions can create operational disruption, financial losses, safety concerns, and reputational damage.

Our cybersecurity consultants help organizations understand and manage these risks throughout the vehicle lifecycle.

secureXmotive provides services covering **TARA, cybersecurity architecture, secure vehicle design, ECU and network security, penetration testing, vulnerability management, secure diagnostics, telematics security, OTA security, incident response, and cybersecurity governance.**

We assess attack surfaces across vehicle networks, diagnostic interfaces, telematics systems, cellular connectivity, Wi-Fi, Bluetooth, mobile applications, cloud platforms, fleet management systems, and backend infrastructure.

Commercial vehicles also introduce unique cybersecurity considerations. A truck may remain connected for years, operate across multiple countries, interact with trailers and implements, and communicate continuously with fleet infrastructure. Buses may connect to passenger-facing systems, depot infrastructure, and public networks. These complex ecosystems require cybersecurity strategies that go beyond protecting individual ECUs.

Our Commercial Vehicle Cybersecurity Services

- Truck and bus cybersecurity assessment
- TARA and threat modelling
- Cybersecurity architecture
- CSMS implementation support
- ECU and network security
- Telematics cybersecurity
- Fleet management security
- Diagnostic security
- Penetration testing
- Vulnerability management

- OTA security
- Backend and cloud security assessment
- Connected trailer and implement security
- Incident response planning
- UN R155 and ISO/SAE 21434 support

Secure Vehicles. Secure Fleets. Secure Operations.

At secureXmotive, we understand that commercial vehicle cybersecurity must protect more than the vehicle itself. It must protect the **entire ecosystem connecting vehicles, drivers, fleet operators, workshops, dealers, cloud platforms, and backend systems.**

Our objective is to help commercial vehicle manufacturers build cybersecurity into every stage of the product lifecycle while creating practical processes that can be implemented across large vehicle portfolios and global fleets.

With secureXmotive, cybersecurity becomes an enabler of reliable, connected, and trusted transportation.

secureXmotive — Securing the Future of Commercial Mobility.
